|---|--|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|--|---|---|
| <pre>%codeword %codeword=zeros(N,1); codeword=ones(N,1); %information=randi([0,1],1,N-rank(B)); %B2(rref H) : H' * codeword for i = 1:rank(A) a(i)=min(find(A(i,:)==1)); %pivot 위치 파악 : pivot position - parity bits end</pre> | 해당 코드 부분에서 rank(A)를 구한 이유는 그만큼, pivot이 존재한다는 것이기에, 다음과 같이 코드 구성. | | | | | | | | | | | | | | | | | | | | | | | | | |
| <pre>A =</pre> <table><tr><td>1</td><td>0</td><td>1</td><td>0</td><td>1</td></tr><tr><td>0</td><td>1</td><td>0</td><td>0</td><td>1</td></tr><tr><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td></tr></table> <pre>>> a</pre> <pre>a =</pre> <table><tr><td>1</td><td>2</td><td>4</td></tr></table> | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 2 | 4 | 따라서 a를 통해, pivot의 위치를 열 기준으로 파악할 수 있다. A의 경우, 1,2,4번째 열에 pivot이 있기에, '1,2,4'가 출력된다. The reason for calculating rank(A) in code is that there are pivot. rank(A)=number of pivot. For example, matrix "A"'s rank is 3 and the position of pivot is 1 st , 2 nd , 4 th column. | | |
| 1 | 0 | 1 | 0 | 1 | | | | | | | | | | | | | | | | | | | | | | |
